

Sollution to Pollution

Today we are facing a lot of ecological problems. Perhaps one of the biggest problems is starvation, the worst form of hunger. It is a problem because the food is not equally distributed.

Another problem are pesticides. We use them to control and kill pests. It does harm to humans, animals and the environment. We also have acid rains. They are caused by human activities such as the use of fossil fuels. Most harm is done to water which becomes toxic. It also destroys forests and it is called deforestation. Trees produce oxygen and use carbon dioxide. If we cut them down, there will be more carbon dioxide and less oxygen in the air. Finally, we mustn't forget the problem of global warming. High temperatures cause floods, droughts, extreme weather changes. There are a lot of things we can do to stop this. We should recycle, cut less trees, use less pesticides and do more walking instead of driving.

I save electricity, water, separate rubbish and throw it into special containers for recycling. I am aware of the problems we are facing today but I am not obsessed with it like some people. Still, I do some things to solve the problems.
